Celestron EdgeHD differences are clear.

Celestron EdgeHD aplanatic Schmidt optics don't just reduce coma. The dual-element field flattener in their baffle tubes makes their focal planes far flatter than any competing coma-free design and over three times flatter than a standard SCT.

- Their smaller (more concentrated) stars improve resolution and limiting magnitude compared to other equal-aperture scopes.
- Celestron EdgeHD stars are sharper and more pointlike all the way across the field of some of the largest CCD chips available today.
- There are 10 Celestron EdgeHD models available as 8", 9¼", 11", and 14" optical tubes, and as complete telescopes on Celestron CGEM and CGE Pro mounts.
- All Celestron EdgeHD scope optics are Fastar compatible for imaging down to an ultra-fast f/2 focal ratio with optional accessories.

A Celestron CGEM is a jewel of a telescope.

Celestron CGEM go-to telescopes put Celestron's premium time-tested Schmidt-Cassegrain optics on a new German equatorial mount whose high payload capacity and advanced features set bold new performance and value standards.

Each CGEM is very sensibly priced for the top quality performance it gives you. It's like getting a genuine diamond for the price of a rhinestone.

You already know about Celestron's superb SCT optical quality and the extraordinary efficiency of their StarBright XLT optical coatings. Add to those virtues the new CGEM mount's 40 pound payload capacity; a 40,000+ object NexStar go-to computer with unique *All-Star* polar alignment; 5° per second slewing; permanent periodic error correction; stainless steel tripod; and more. You pay for a rhinestone, but you get a genuine Celestron diamond. *What a deal!*
