

Some cats have coma. A Meade LX200-ACF doesn't.

A lot of telescopes have coma, the optical flaw that turns stars into seagulls at the edges of the field. Meade LX200-ACF catadioptrics don't. They have Advanced Coma-Free (ACF) optics that make your stars look like stars, not seagulls, across the entire field. You get the coma-free images of a costly Ritchey-Chrétien telescope, but at only a fraction of an R-C's price.

GPS, primary mirror lock, Smart Drive, Permanent Periodic Error Correction, 145,000 object go-to AutoStar II computer – 8" to 16"
Meade LX200-ACF scopes are loaded for bear and ready for imaging.
